Let's see what we have. Here is one of obfuscated .net cackme samples. DetectItEasy as ussual doesn't detect what obfuscator is used in this case.

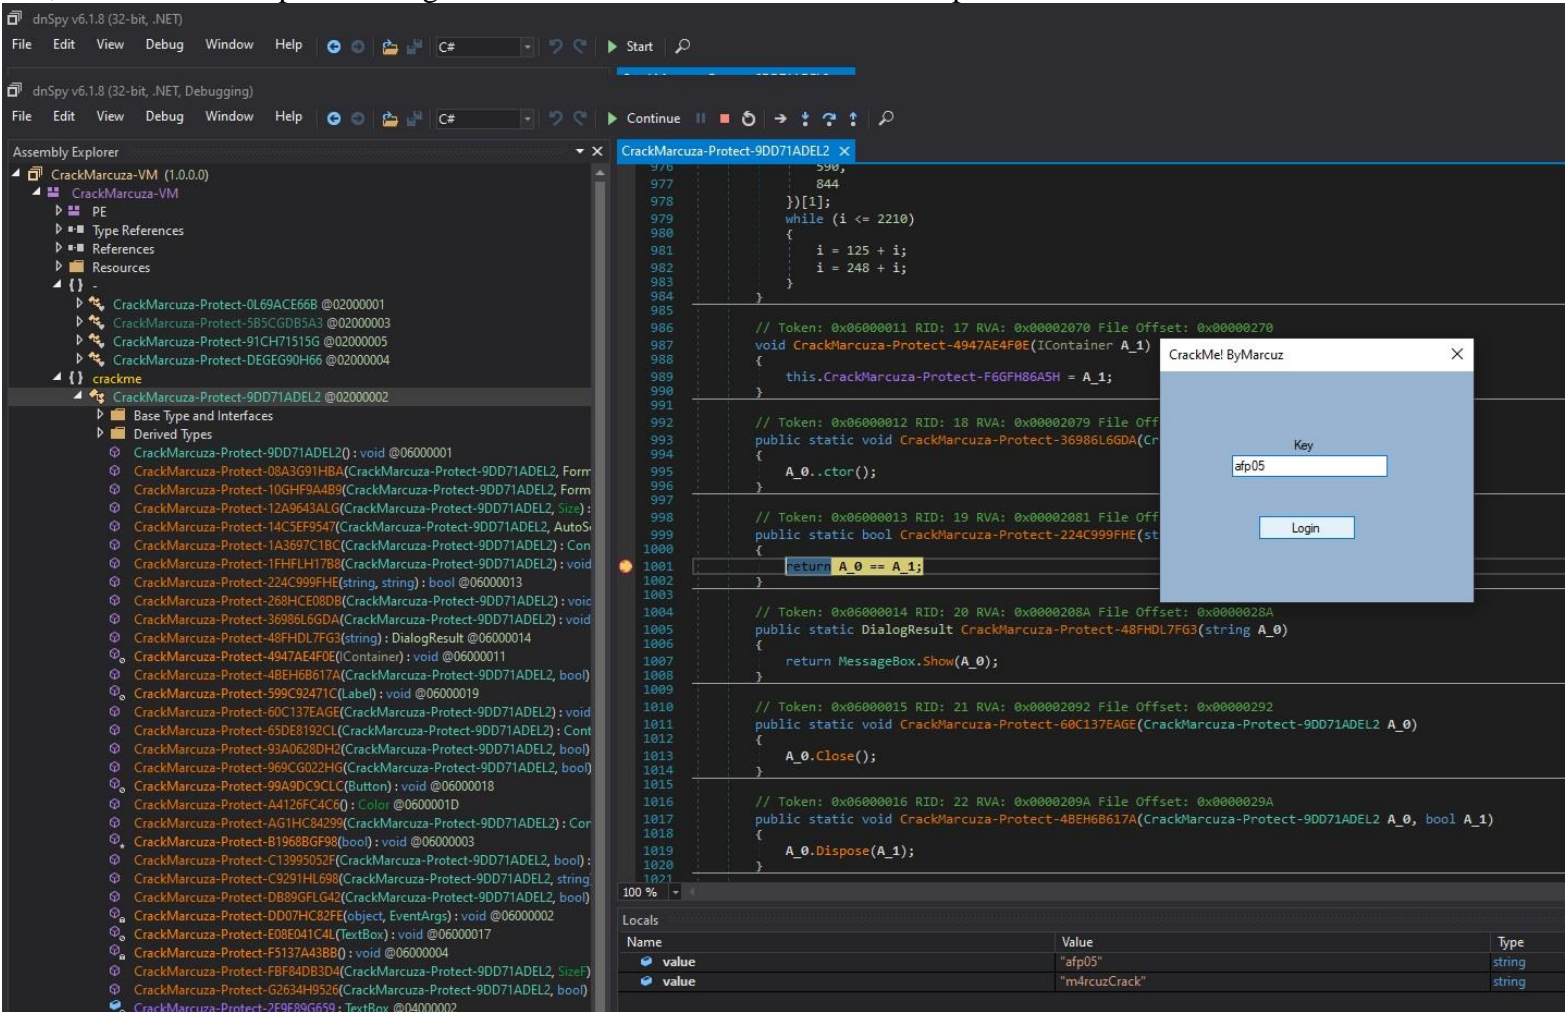

Let's try to open it in DNSpy. What we see? We have about 30-40 methods in this project. Let us see each of them, and 1 method looks like checking flag. Let us see deeper and click on CrackMarcuza-Protect-224C999FHE. It takes text from textbox as a parametr.
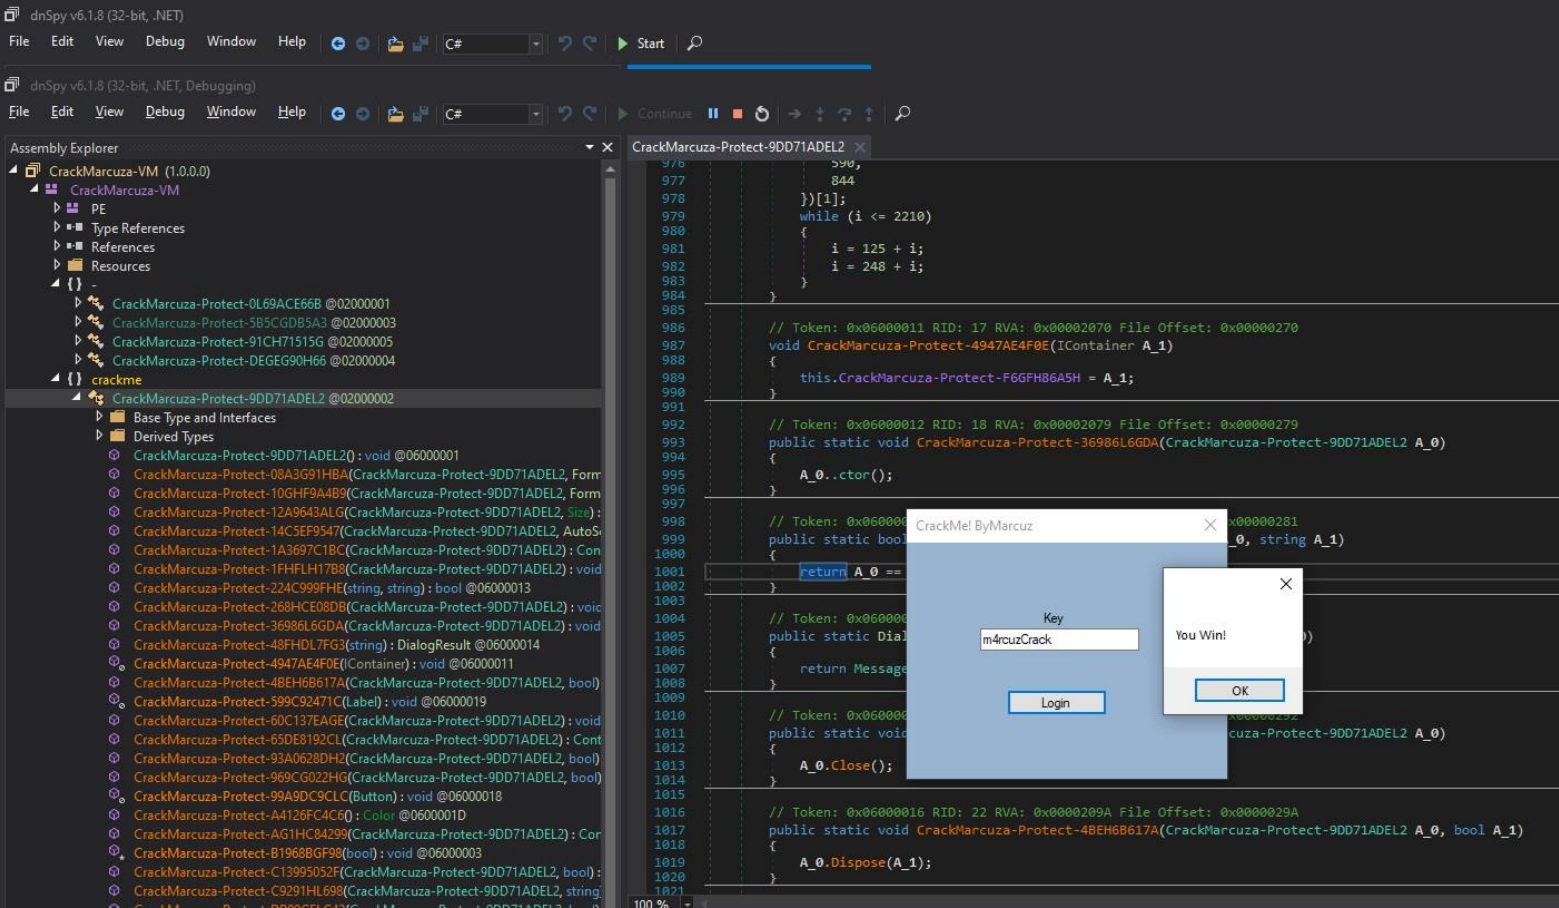

Yes, this method compare 2 strings and returns a bool value. Let's set brakpoint and run.

We were right! This method compare 2 strings and 1 of them is a string of textbox, we entered and the other i a password.
Lets try to enter a value of the second string.

That's it. Challenge completed.
